Country : USSR
 Category : Farm Animals, Poultry. Q-4
 Abs. Jour : RZBiol., No. 4, 1959, No. 16744
 Author : Yustratova, V.
 Institut. : Moscow Academy of Agriculture Iacni K. A.*
 Title : The Effect of Changing Feed Mixtures when Fattening Young Chickens.
 Orig. Pub. : Sb. stud. nauchno-issled. rabot. Mosk. s.-kh. akad. im. K. A. Timiryazeva, 1958, vyp. 3,**
 Abstract : If feed mixtures were changed in the morning, at lunchtime, and in the evening, a larger average daily weight gain was obtained than if the same feeds were given during the entire experiment. For the period from 11 December to 6 January the average weight gain amounted to 267 g in the 1st experimental group and to 247 g in the control group.

Title : Guiding the Growth and Fruit Production of the Apricot.

Orig Pub : Zap. Voronezhsk. s.-kh. in-ta, 1956, 26, No 2, 50-60

Abstract : The following A.N. Ven'yaminov apricot varieties were studied under Voronezhskaya oblast' conditions: Triumf Severnyy, Uspek, Desertnyy, Laureat, and others. It was determined that the basic reason why the flowering buds of apricots die under the conditions of the middle belt was connected with the short period of physiological calm. The apricot completes its development in the second half of winter and, if temperature conditions are right, starts flowering, but if cold weather sets on

again the flowering buds are killed. Flowering buds on long branches which have emerged rather late are much more frost resistant than the flowering buds of short bouquet branches. By clipping, the fruit bearing zone can be shifted to the secondary (summer) branches. The Character of growth alters greatly under the influence of summer clipping, as does the character of fruit production, and the dates when the flowering buds appear. When the previous year's shoots are clipped off, the quantity of secondary branches is increased. Summer clipping delays the differentiation of flowering buds in the secondary branches for about 30 days; it delays the leaf falling by 5-7 days. Under the production conditions of the middle belt of the USSR it is recommended that 2/3 of the previous year's branches be removed early in autumn and that subsequently 1/2 of the current year's shoots be

Synthesis and conversion...

hydroxyl groups in these compounds by their conversion to the corresponding acetals. The synthesis of I and II entails the reaction of propinol with the Grignard reagent; the mixing of the solution for 3 hr. as it is cooled to -5° ; the addition of triethylgermanium chloride; the solution of the residue after about 8 - 12 hrs. in water and dil. HCl; the removal of the ether layer; and the double multiple distillation of the remaining solution when the desired alcohols boil over at $107 - 108^{\circ}$ and $110 - 111^{\circ}$ respectively. III and IV are prepared by stirring a mixture of I and II with vinylbutyl ether and HCl which is then heated for 1 hr. at $35 - 95^{\circ}$ and allowed to stand overnight. After neutralization and removal of the ether, the acetals are obtained by double multiple distillation, their respective boiling-points being $146 - 148^{\circ}$ and 152° . There are 1 table and 2 Soviet-bloc references.

PERIODICAL:

TEXT: The results are described of investigations carried out during the last fifteen years at the Teplotekhnicheskaya laboratoriya (Thermal Engineering Laboratory) of the Energeticheskiy institut AN Azerbaydzhanskoy SSR (Power Engineering Institute AS Azerbaydzhan SSR). In the paper: "Termodinamika gazov, malo otklonyayushchikhsya ot ideal'nykh" (Thermodynamic gases differing little from ideal gases) the following conclusions are arrived at: 1) the thermodynamics of such gases can be considered as being a particular section of technical thermodynamics; 2) the subject can be presented in an analytical form on the basis of the molecular-kinetic theory; 3) it is possible to derive a generalized equation of state for such gases. In the paper "Teoreticheskoye obosnovaniye novykh metodov postroyeniya politropicheskikh krivyykh" (Theoretical substantiation of new

Card 1/3

Results of some thermo-technical ...

S/196/63/000/001/019/035
E073/E435

methods of constructing polytropic curves) practical proposals are made in the form of reference material on the plotting of curves of parabolic, hyperbolic and exponential functions most frequently used in technical calculations. Work is carried out on determining the distribution constants of hydrocarbons and of narrow petroleum fractions as well as on determining the thermodynamic properties (specific volumes, enthalpies, entropies etc) of individual hydrocarbons. The work relating to the determination of the heat transfer coefficient in heat exchangers during boiling of benzene and kerosene deals with: 1) appearance of an "inflection" in the relation $\alpha = f(q)$ for the case of evaporation of mixtures of hydrocarbons on the external surface of tubes under conditions of natural convection; 2) empirical formulae of the type $\alpha = f(w, p)$ and $\alpha = f(q, p)$ have been obtained, where q - heat flow, p - pressure, w - steam velocity; 3) the critical states of the investigated substances were found. Investigations of the process of heat release during condensation of water, ammonia, benzene and toluene as a function of various parameters of the vapour and geometrical configurations

Card 2/3

Results of some thermo-technical ...

S/196/63/000/001/019/035
E073/E435

of the condenser yielded expressions of the following type:
 $\alpha = f(w, p)$ and $\alpha = f(q, p)$ in the form $\alpha = 170.5 p^{0.14} q^{0.43}$,
 as well as criterion equations. Work on investigating heat
 release from a gas-solid body to the wall of a cooling tube
 revealed that the heat release of a two-phase flow increased with
 increasing diameter of particles of the solid phase, difference in
 densities of the phases and the concentration of solid particles
 in the flow. The content of papers in the field of semi-coking of
 acidic oil tars as well as on investigating other Azerbaijan
 oil-shales are reported on. 17 references.

TITLE: Effect of welding heat on the physical properties of ATsM alloy

SOURCE: Svarzhnove proizvodstvo, no. 7, 1966, 12-14

... alloy, zinc containing alloy, magnesium

ing, alloy weldability, alloy weld, weld strength, ATsM alloy

ABSTRACT: Welded joints in ATsM aluminum alloy (4.2—4.8% zinc, 1.6—2.1% magnesium, 0.4—0.8 manganese, and 0.15—0.22% zirconium) fail usually in the fusion zone at a strength equal to 0.85—0.96 of the strength of the base metal. Therefore, in welding this alloy a special joint design is used (see Fig. 1) to compensate for the loss of

Fig. 1. Layout of an aluminum-alloy butt joint

strength in the fusion zone. The subject of this study was to determine the necessary width of the reinforced portion with particular attention to the effect of additional

to 10 mm, this distance is 20—25 mm and in a sheet 10 mm thick, 35 mm. In the fusion zone, where temperature reaches 500—550°C, a partially hardened zone is formed. The degree of softening in the weld-adjacent zone depends upon the thermal welding cycles; it occurs in a range of 100—290°C as a result of precipitation and coagulation in the strengthening phase. The degree of softening depends upon the time the zone remains under the effect of critical temperature (150—290°C) at which the precipitation and coagulation occur. Aging narrows the width and increases the hardness of the zone softened by repair welds. The design strength of welded joints should be calculated taking into consideration the effect of repair welds and should be based on both the thickness and width of the reinforced portion of the parent sheet. For sheets 3—6 mm thick, the reinforcement of each edge should be 45 mm, and for a sheet 7—10 mm thick, 60 mm. Orig. art. has: 1 figure and 4 tables. [ND]

TITLE: Welding peculiarities of an aluminum-zinc-magnesium alloy

SOURCE: Avtomaticheskaya svarka, no. 3, 1964, 37-43

TOPIC TAGS: welding, Al Zn Mg alloy welding, AMg6N alloy welding, V92 alloy welding, aluminum alloy weld strength

ABSTRACT: The peculiarities of automatic welding of Al-Zn-Mg alloy were studied with 3.5-10-mm thick plates argon-ac-arc welded with a W electrode and an AMg6 wire. The distribution of metal strength around the welds made from Al-Zn-Mg alloy and — for comparison — from standard AMg6N and V92 alloys was studied. Also, the effect of manual root welding (correcting welding defects) upon the weld quality was investigated. These results are reported: (1) The

Card 1/2

ACCESSION NR: AP4020102

tendency to crack in Al-Zn-Mg alloy welds is lower than that in AMg6 and V92 welds; (2) The strength factor determined on flat specimens with reinforced welds is 0.85-0.96; (3) With sheets 4-5-mm thick, the optimum width of the structural reinforcement is 45 mm; with plates 9-mm thick, it is 60 mm; (4) The probable zone of softening should be taken into account in selecting the minimum distance between welds; (5) The diameter of the flange-to-plane ring weld should be 100 mm or more; automatic welding should be used; (6) Auxiliary manual double welding cuts the weld strength to 0.68 of the base-metal strength. "Engineers Yu. N. Skachkov, A. Ye. Trulichev, and Yu. P. Parmanov took part in the project." Orig. art. has: 3 figures and 4 tables.

TITLE: Multilayer argon shielded arc welding of ATsM alloy shapes

SOURCE: Svarochnoye proizvodstvo, no. 6 (630), 1964, 8-10

TOPIC TAGS: aluminum alloy, ATsM alloy, aluminum zinc magnesium alloy, alloy welding, TIG welding, alloy weld, weld property

ABSTRACT: The ATsM high-strength aluminum-zinc-magnesium alloy is rather frequently used in the form of extruded solid and hollow shapes of complex cross section (see Fig. 1 of the Enclosure), from which ring-shaped parts are manufactured by bending and welding. In the heat treated (solution annealed at 450C and aged at 100C for 100 hr) condition the alloy has excellent mechanical properties. The alloy is self-heat-treatable, i.e., under certain conditions its mechanical properties are unaffected by welding. Single-pass welds made with the automatic argon shielded arc in sheets up to 6 mm thick or single-pass welds made with the automatic three-phase argon shielded arc in sheets up to 12 mm thick have a strength equal to that of the base metal. However, in the manual welding of heavy sections the

Card 1/3

ACCESSION NR: AP4040695

base metal strength decreases in proportion to the length of time the metal remains exposed to dangerous temperatures. The heat-affected zone in solid shapes is much wider than in hollow shapes. The strength of manually TIG welded joints artificially aged after welding varied, depending on the number of passes, from 27.6 to 34.5 kg/mm² for hollow shapes and from 25.6 to 31.0 kg/mm² for solid shapes. The failure always occurred in the heat-affected zone. The decrease of the base metal strength in the heat-affected zone is associated with the decomposition of the solid solution and coagulation of the MgZn₂ strengthening phase along the grain boundaries. The width of the heat-affected zone was 200—210 mm for hollow shapes and up to 280—300 mm for solid shapes. To improve the weld strength in structures made from ATsH alloy shapes, a switch to new resistance and cold welding methods is suggested. Orig. art. has: 4 figures and 3 tables.

TITLE: On the Best Mean Approximation of Summable Functions with the Aid of Entire Functions of Finite Order (O nailuchshem priblizhenii v srednem summiruyemykh funktsiy posredstvom tselykh funktsiy konechnoy stepeni)

PERIODICAL: Tr. In-ta fiz. i matem. AN AzerbSSR, 1955, 7,
pp. 71-85

ABSTRACT: For functions $f(x) \in L(-\infty, \infty)$ it is proved that

$$1) A_p(f)_L \leq C\omega(f, \delta), 2) \omega(f, \delta) \leq 2A_p(f)_L + p\delta M$$

where $A_p(f)_L$ is the best approximation of f with the aid of entire functions of P order in the metric $L(-\infty, \infty)$; $\omega(f, \delta)$ is the modulus of continuity f in the same metric; and C and M are constants. Analogous theorems are proved for functions of two variables. In addition, the valuation
